Step 1: Find the average amount paid by the top 5 customers.
1. Copy the query you wrote in step 3 of the task from Exercise 3.7: Joining Tables of Data into the Query Tool. This will be your subquery, so give it an alias, "total_amount_paid," and add parentheses around it.
2. Write an outer statement to calculate the average amount paid.
3. Add your subquery to the outer statement. It will go in either the SELECT, WHERE, or FROM clause. (Hint: When referring to the subquery in your outer statement, make sure to use the subquery's alias, "total_amount_paid".)
4. If you've done everything correctly, pgAdmin 4 will require you to add an alias after the subquery. Go ahead and call it "average".
5. Copy-paste your queries and the final data output from pgAdmin 4 into your answers document.

Query   Query History

```
1   SELECT AVG(total_amount_paid) AS average
2   FROM
3   (SELECT B.customer_id,
4          B.first_name,
5          B.last_name,
6          D.city,
7          E.country,
8          SUM(A.amount) AS Total_Amount_Paid
9   FROM customer B
10  INNER JOIN payment A ON A.customer_id = B.customer_id
11  INNER JOIN address C ON B.address_id = C.address_id
12  INNER JOIN city D ON C.city_id = D.city_id
13  INNER JOIN country E ON D.country_id = E.country_id
14  WHERE D.city IN ('Aurora', 'Atlixco', 'Xintai', 'Adoni', 'Dhule (Dhulia)', 'Kurashiki', 'Pingxiang', 'Sivas', 'Celaya', 'So Leopoldo')
15  GROUP BY B.customer_id, B.first_name, B.last_name, D.city, E.country
16  ORDER BY Total_Amount_Paid DESC
17  LIMIT 5) AS total_amount_paid
```

Data output   Messages   Notifications

	average numeric
1	107.3540000000000000

Step 2: Find out how many of the top 5 customers are based within each country.
Your final output should include 3 columns:
- "country"
- "all_customer_count" with the total number of customers in each country
- "top_customer_count" showing how many of the top 5 customers live in each country

You'll notice that this step is quite difficult. We've broken down each part and provided you with some helpful hints below:

1. Copy the query from step 3 of task 3.7 into the Query Tool and add parentheses around it. This will be your inner query.
2. Write an outer statement that counts the number of customers living in each country. You'll need to refer to your entity relationship diagram or data dictionary in order to do this. The information you need is in different tables, so you'll have to use a join. To get the count for each country, use COUNT(DISTINCT) and GROUP BY. Give your second column the alias "all_customer_count" for readability.
3. Place your inner query in the outer query. Since you want to merge the entire output of the outer query with the information from your inner query, use a left join to connect the two queries on the "country" column.
4. Add a left join after your outer query, followed by the subquery in parentheses.
5. Give your subquery an alias so you can refer to it in your outer query, for example, "top_5_customers".
6. Remember to specify which columns to join the two tables on using ON. Both ON and the column names should follow the alias.
7. Count the top 5 customers for the third column using GROUP BY and COUNT (DISTINCT). Give this column the alias "top_customer_count".
8. Copy-paste your query and the data output into your "Answers 3.8" document.

Query   Query History

```
 1  SELECT DISTINCT (A.country),
 2                  COUNT (DISTINCT D.customer_id) AS all_customer_count,
 3                  COUNT (DISTINCT A.country) AS top_customer_count
 4  FROM country A
 5  INNER JOIN city B ON A.country_id = B.country_id
 6  INNER JOIN address C ON B.city_id = C.city_id
 7  INNER JOIN customer D ON C.address_id = D.address_id
 8  LEFT JOIN (SELECT A.customer_id, A.first_name, A.last_name, B.city, E.country, SUM(C.amount) AS Total_Amount_Paid
 9          FROM customer A
10          INNER JOIN address D ON A.address_id = D.address_id
11          INNER JOIN city B ON D.city_id = B.city_id
12          INNER JOIN country E ON B.country_id = E.country_id
13          INNER JOIN payment C ON A.customer_id = C.customer_id
14          WHERE E.country IN ('India', 'China', 'United States','Japan', 'Mexico','Brazil','Russian Federation','Philippines','Turkey','Indonesia' )
15          AND B.city IN ('Aurora', 'Atlixco', 'Xintai', 'Adoni', 'Dhule (Dhulia)', 'Kurashiki', 'Pingxiang', 'Sivas', 'Celaya', 'So Leopoldo')
16          GROUP BY A.customer_id, E.country, B.city
17          ORDER BY Total_Amount_Paid DESC
18          LIMIT 5) AS top_5_customers
19          ON A.country=top_5_customers.country
20  GROUP BY A.country, top_5_customers
21  ORDER BY all_customer_count desc
22  LIMIT 5
```

Data output   Messages   Notifications

	country character varying (50)	all_customer_count bigint	top_customer_count bigint
1	India	60	1
2	China	53	1
3	United States	36	1
4	Japan	31	1
5	Mexico	30	1

Step 3:
1. Write 1 to 2 short paragraphs on the following:
   - Do you think steps 1 and 2 could be done without using subqueries?
   - When do you think subqueries are useful?

Step 1 could have been completed without using a subqueries while I believe step 2 could not have. With step 1, using the HAVE command in addition to aggregate functions, we could have come to the same conclusion. On the other hand, step 2 joins multiple tables in a way that makes subqueries the most effective and accurate way to gather the requested information. Therefore, I believe subqueries are useful when making very complex queries that advanced filtering and joining of tables to gather information.
